# READY, SET, SEE.

After cataract surgery, you'll see through a new lens called an IOL. **Your doctor will consider a variety of options and select the right IOL for your needs.**

# SIGHT AFTER CATARACTS.

Cataract surgery is trading one thing for another. When your cataract is removed, it is replaced by a small, artificial lens called an intraocular lens — or IOL for short. You won't be able to feel or see the IOL, but it will stay inside your eye to help you see clearly.

**Monofocal IOLs are designed specifically to help you focus at a distance.**

## TECNIS™

1-Piece IOL

TECNIS™ 1-Piece IOLs are designed to deliver high-quality vision from day to night<sup>1</sup> so you can see the things you love with clarity.

With Cataracts

Without Cataracts

*These images are for illustrative purposes only and do not represent actual data derived from studies. These illustrative simulations are intended to help you better understand your vision in certain eye conditions.*

Help you see things in the distance, like street signs, stage performances and sporting events

May increase safety in low-visibility situations such as driving at night<sup>1</sup>

Specialised for distance vision, so you'll likely need glasses to see closer

Ask your doctor about other IOL opportunities — including astigmatism management, personalised near vision and continuous vision across the full visual range.

Talk to your doctor about your visual needs and find out if **TECNIS™ 1-Piece IOLs** are right for you.

Blurry or hazy vision and reduced intensity of colours

Increased sensitivity to halos and glare around bright lights

Increased difficulty seeing at night

Removed with an outpatient surgery
