Vision

Astigmatism is a lengthy word with a simple explanation: the shape of your eye is more oblong than circular, which prevents you from focusing properly. **Most people are born with some degree of astigmatism,¹ but it does affect some more than others.**

FIND YOUR FOCUS

A range of vision that's as dynamic as your life.

Cataract surgery is trading one thing for another. When your cataract is removed, it is replaced by a small, artificial lens called an *intraocular lens* – or *IOL* for short. You won't be able to feel or see the IOL, but it will stay inside your eye to help you see clearly.

TECNIS
Synergy™
OptiBlue™ IOL
Toric II

TECNIS Synergy™ OptiBlue™ Toric II IOLs address astigmatism, and even presbyopia, as part of cataract surgery.²

ASTIGMATISM

Distorts and blurs vision

Can lead to eye discomfort and headaches

Can be addressed with a toric IOL

Other solutions include prescription glasses and contacts made for astigmatism or an additional surgery

With presbyopia and astigmatism

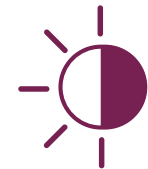

With TECNIS Synergy™ OptiBlue™ Toric II IOLs
